F1 - F1 Planning, Budgeting & Forecasting

ERP finance process flow & data reference

Plan, budget and reforecast cycle: set the calendar and method, plan operational drivers, create versions, reforecast with actuals and benchmark accuracy.

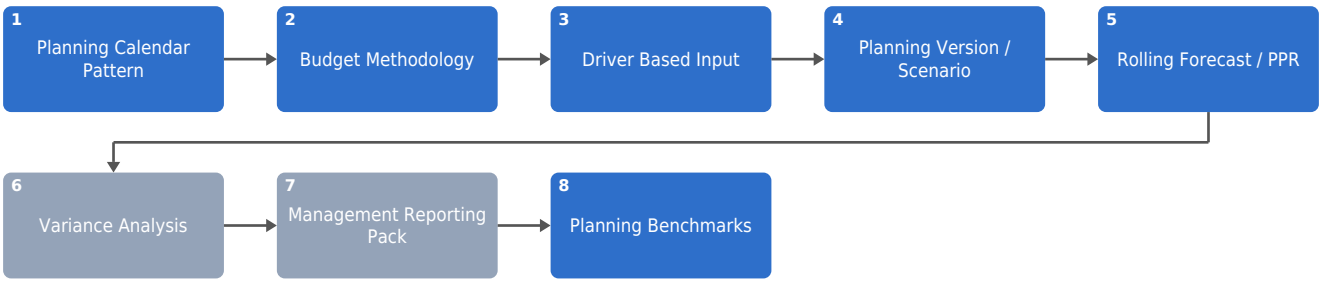

Typical source systems: EPM planning tool (for example SAP BPC / SAC, Oracle EPM, Anaplan) fed with ERP actuals

ERP process flow

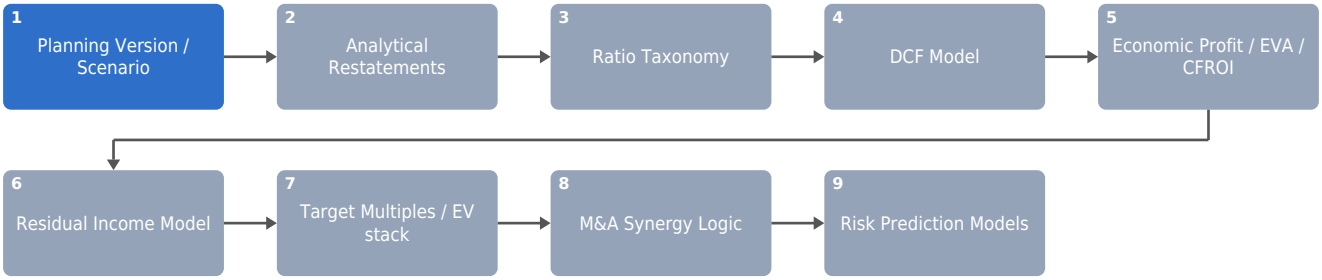

End-to-end flows this domain takes part in

Plan-to-perform

Q1–Q4 calendar → methodology (ZBB/driver/rolling) → drivers → versions → PPR reforecasts → variance → pack; benchmarked at 104/103%

Forecast-to-value

Forecasts + restated statements → ratios → DCF (NOPLAT/FCF/CV) ⇄ economic profit (must tie) → target multiples → M&A synergy pricing

Coloured boxes belong to this domain; grey boxes belong to other domains.

Entities and data

Entity	Definition	Key data attributes
PlanningVersion / Scenario	The version backbone of planning: actual · plan/budget (annual plan, 1YP) · reforecast (PPR-n = n months actual + remainder forecast) · latest estimate · prior year · constant-FX variants · scenario slots, with organic flags and driver-based inputs.	versionType; pprCycle; organicFlag; constantFxVariants; scenarioSlot; workflowState
BudgetMethodology	The methodology set evidenced across the corpus: top-down target vs bottom-up, driver-based, rolling, zero-based (ZBB with cost-package ownership), activity-based, and adaptive/lean with quarterly reviews.	methodology; zbbCostPackages; targetCascade; reviewCadence; sandbagging (anti-pattern)
PlanningMaturityCurve	4-level maturity: Ad-hoc → Traditional (static annual Excel) → Coherent & Diagnostic (driver-based + rolling forecast + workflow + multidimensional variance) → Prescriptive (predictive, scenario, suggested decision options).	maturityLevel (1–4); levelCriteria; assessmentPerProcess

Entity	Definition	Key data attributes
SimulationClass	Deterministic simulation (rule-driven, ~1yr history, ~1-month time-to-value) vs stochastic (multivariate, full business cycle 3–5yrs of data, exogenous drivers FX/commodity/fuel/credit, 2–3-month time-to-value).	simType; dataHorizon; exogenousDrivers[]; timeToValue
PlanningCalendarPattern	The evidenced annual rhythm: Q1 AOP actualization · Q2 full-year forecast · Q3 balance-sheet bottom-up · Q4 AOP-level forecast — reforecast cycles (PPR) interleave monthly.	quarterPattern; aopMilestones; pprSchedule
DriverBasedInput	Operational drivers planned first and translated into cost/revenue lines — fuel price, trips, line speed, volume, rate cards — the mechanic that lifts planning from account-level guesswork to causal models.	driverName; driverUom; mappingToAccount; elasticity; driverTree
RollingForecast / PPR	Reforecast machinery: PPR-n versions blend actuals and forecast; rolling forecasts extend beyond year-end to kill the fiscal-year cliff; modernization practice pairs it with workflow and variance analytics.	horizon; blendRule (n actual + 12−n fc); cadence; workflow
PlanningBenchmarks	Best-in-class planning performance: budget accuracy 104% (actual/budget), forecast accuracy 103%, best-in-class are 400% more likely to link compensation to budget performance; budget-cycle compression benchmark −65%.	budgetAccuracy 104%; forecastAccuracy 103%; compLinkage ×4; budgetCycle −65%
